			Pb	RoHS 2002/95/EC

The **E32 Series** provides three outputs including 24V/5A, 12V/10A and 5V/25A from 18~36V or 36~75V input ranges with first-in-industry Hex-Brick metal package that operates at -60ºC~+130ºC temperature range. The efficient converter core is designed with patented *"Buck-Reset Forward"* topology, which cooperates with special designed *"Partial-Resonant-Synchronous-Rectifier"* stage at 500kHz switching frequency for efficiently delivering more power to achieve 94% of conversion efficiency and 230W/in³ power density.

A proprietary ultra-fast current limiting circuit is also embedded in the E32 series to eliminate the long existing technical challenge of *"Short-Circuit-Current-Runaway"*, which is a destructive high output current driven by the minimum output voltage in proportion with the propagation delay flowing through the short circuit loop or the low-impedance non-Ohmic loads. The propagation delay of the E32 series with ultra-fast current limiting can be as short as 60nS, effectively shifting the current limit set point higher than that of conventional converters without reliability impact, and makes it even more suitable for powering the non-Ohmic loads. For providing higher power and improving the system reliability, the E32 Series utilizes a proprietary wide-band *"Droop Current Sharing"* control circuit, which allows directly connecting the outputs of modules without a noise sensitive current share bus. The system built by paralleling multiple E32 modules is capable to respond full scale step load within 20µS without evidently overshot and ringing, which can trigger the OCP in the power system employed with a low bandwidth current control loop for balancing the modules.

Not only focusing on the conversion performances, the E32 Series is also designed with higher environmental resistances. All the power semiconductor chips are attached onto the inner surface of the low profile metallic case to spread heat to the outer surface homogeneously, and further result in lower thermal resistance with forced-air cooling. The E32 modules can be double-sides attached to external cooling means by using two screws, which provide sufficient mechanical strength for installing E32 module on high temperature and dusty environment with harsh vibration. The vacuum potted high thermal conductivity silicone helps with heat transfer and maintains hydrostatic pressure balance in the high strength metallic case to withstand pressure range from 1mBar to 100Bar. All the special design efforts embedded in this product effectively simplify the system power design of deep water probes, high altitude instruments and other equipments that the conventional module cannot be used.

MODEL NUMBER SYSTEM

E32	24	120	a	-	XX
Series Name	Input Voltage	Output Voltage	Enable Logic		Setting
E32	**24:**18V~36V **48:**36V~75V	**120=** 12.0V **050=** 5.0V	**P:** Positive **N:** Negative	-	For customer function only

The selected option code for the "**a**" section in the model number determines what enable logic will be applied in production. For example, the **E3224120N-10** module is configured to has negative enable logic.

VOLTAGE DROP COMPENSATION

The resistors R_{+OUT} and R_{-OUT} on the right-hand side circuit represent the impedances of the power distribution bus contributing voltage drops V_{+BUS} and V_{-BUS} respectively. The voltage drop V_{+BUS} can be eliminated by connecting the +S to the positive node of the load. The -S pin functions differently as it can disable the droop current sharing, compensate the voltage drop V_{-BUS}, manipulate the load regulation of droop current sharing function or enhance the step load performance.

By connecting a resistor R_{-S} between the -S pin and the negative node of the voltage on the load can be regulated. The values of R_{-S} for eliminating different V_{-BUS} and droop current sharing regulation at full load condition are listed in table below, which can be calculated from the equation right-hand below by leting $I_O= I_{RATED}$ and $V_O= V_{RATED}$. Precision resistor with less than 1% of tolerance is recommended for R_{-S}.

$$R_{-S}=\frac{(5\,V_{-BUS}+\frac{0.05\,I_O}{I_{RATED}})\,V_{RATED}}{V_O+V_{-BUS}+(\frac{I_O}{60\,I_{RATED}}-1)\,V_{RATED}}-3$$

V$_{-BUS}$	25mV	50mV	75mV	100mV	125mV	150mV	175mV	200mV	225mV	250mV
R$_S$(Ω)	5.08	8.25	10.42	12.00	13.20	14.14	14.90	15.53	16.05	16.50

TRIM AND TRIM TABLE

The output of the E3224050a-25 power module can be adjusted for higher or lower than the rated voltage level by connecting the TRIM pin through a resistor to the pins of -S or +S respectively as shown as on the right hand side. The resistor for trimming output voltage higher or lower are denoted as R_U and R_D, which have different resistances for each different output voltage level. The resistance table for trimming the output voltage with 1% of step are listed as below for reference.

VOLTAGE DROP COMPENSATION

The resistors R_{+OUT} and R_{-OUT} on the right-hand side circuit represent the impedances of the power distribution bus contributing voltage drops V_{+BUS} and V_{-BUS} respectively. The voltage drop V_{+BUS} can be eliminated by connecting the +S to the positive node of the load. The -S pin functions differently as it can disable the droop current sharing, compensate the voltage drop V_{-BUS}, manipulate the load regulation of droop current sharing function or enhance the step load performance.

By connecting a resistor R_{-S} between the -S pin and the negative node of the voltage on the load can be regulated. The values of R_{-S} for eliminating different V_{-BUS} and droop current sharing regulation at full load condition are listed in table below, which can be calculated from the equation right-hand below by leting $I_O = I_{RATED}$ and $V_O = V_{RATED}$. Precision resistor with less than 1% of tolerance is recommended for R_{-S}.

$$R_{-S} = \frac{(5 V_{-BUS} + \frac{0.05 I_O}{I_{RATED}}) V_{RATED}}{V_O + V_{-BUS} + (\frac{I_O}{60 I_{RATED}} - 1) V_{RATED}} - 3$$

V_{-BUS}	60mV	120mV	180mV	240mV	300mV	360mV	420mV	480mV	540mV	600mV
$R_S(\Omega)$	13.15	21.37	27.00	31.09	34.20	36.64	38.61	40.24	41.59	42.75

** Please consult Glary Power for manipulating load sharing and dynamic performance.*

TRIM AND TRIM TABLE

The output of the E3248120a-10 power module can be adjusted for higher or lower than the rated voltage level by connecting the TRIM pin through a resistor to the pins of -S or +S respectively as shown as on the right hand side. The resistor for trimming output voltage higher or lower are denoted as R_U and R_D, which have different resistances for each different output voltage level. The resistance table for trimming the output voltage with 1% of step are listed as below for reference.

Trim Up	+1%	+2%	+3%	+4%	+5%	+6%	+7%	+8%	+9%	+10%	-	-	-	-	-	-	-	-	-	-
R_U (KΩ)	324.2	162.1	108.1	81.04	64.83	54.03	46.31	40.52	36.02	32.42	-	-	-	-	-	-	-	-	-	-

Trim Down	-1%	-2%	-3%	-4%	-5%	-6%	-7%	-8%	-9%	-10%	-	-	-	-	-	-	-	-	-	-

DROOP CURRENT SHARING

Fig. 1 shows schematic of the droop current sharing connection by using E32 modules. The droop current sharing function of E32 module allows directly connecting outputs of multiple modules in parallel without current sharing bus. The reliable current sharing is achieved not only by minimizing the output voltage error but also the balancing the impedance of distribution bus. On E32 module, the output voltage error between modules determines the output current error constantly as show in Fig. 2. However, as shown in Fig. 3, the ratio of the shared current error for each module is gradually approaching to zero while the total output current increases.
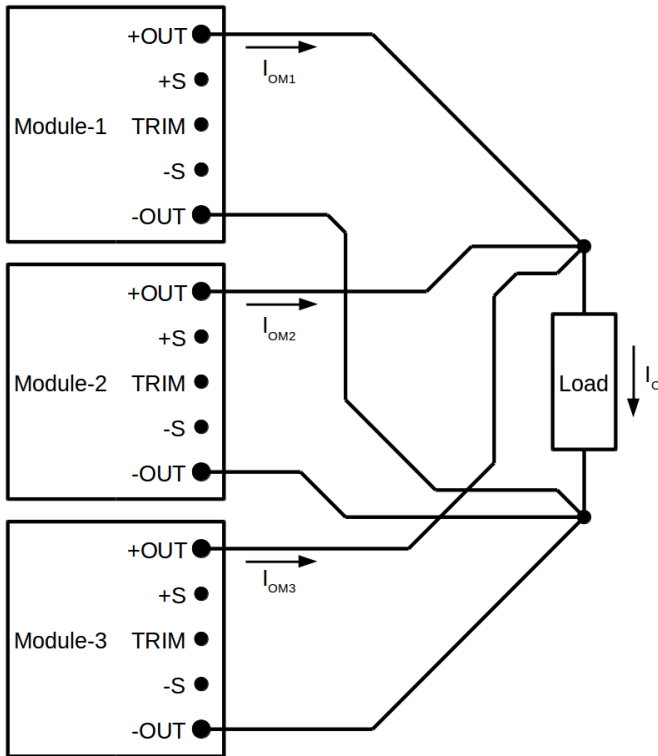

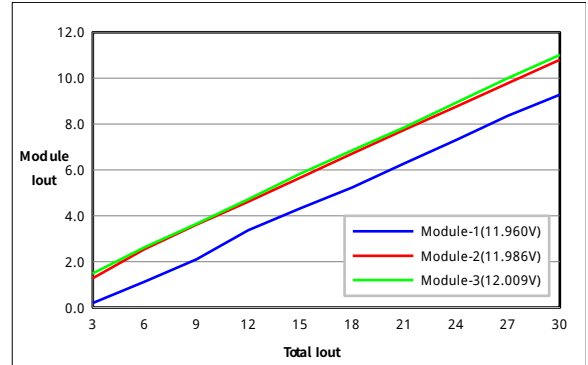

Fig. 1. Schematic of droop current sharing
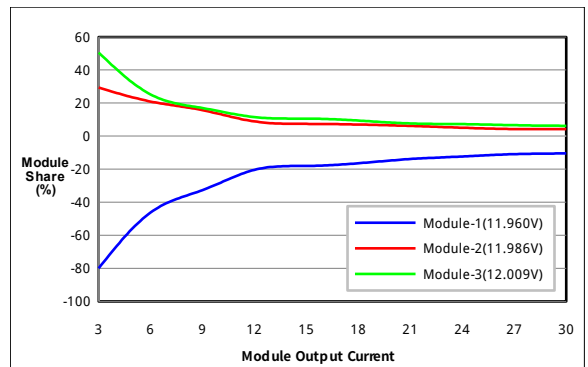

Fig. 2. Current sharing error

Fig. 3. Ratio of current sharing error

The bandwidth of the droop current sharing loop is comparable to that of the voltage loop, which can respond to high current slew rate load transient without high current peak deviation. Fig. 4 shows waveforms of two E32 modules in current sharing responding to a 0A to 20A step load, the maximum current slew rate is 2.5A/μS limited by the used electrical load for testing. The waveform shows that the current error of two paralleled modules in the time period of 0A load is relatively large due to a significantly output voltage error, which has been reduced with a very short of settling time in the time period of the 20A load current.
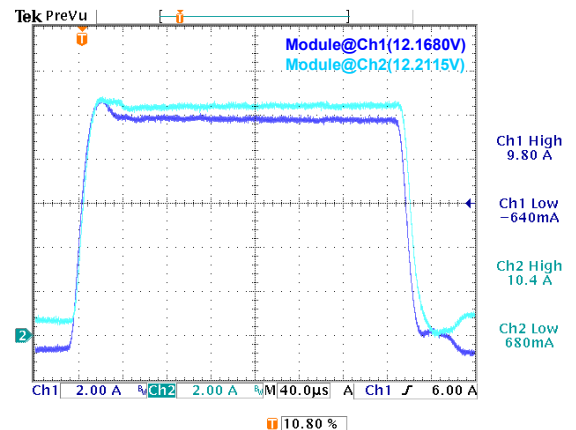

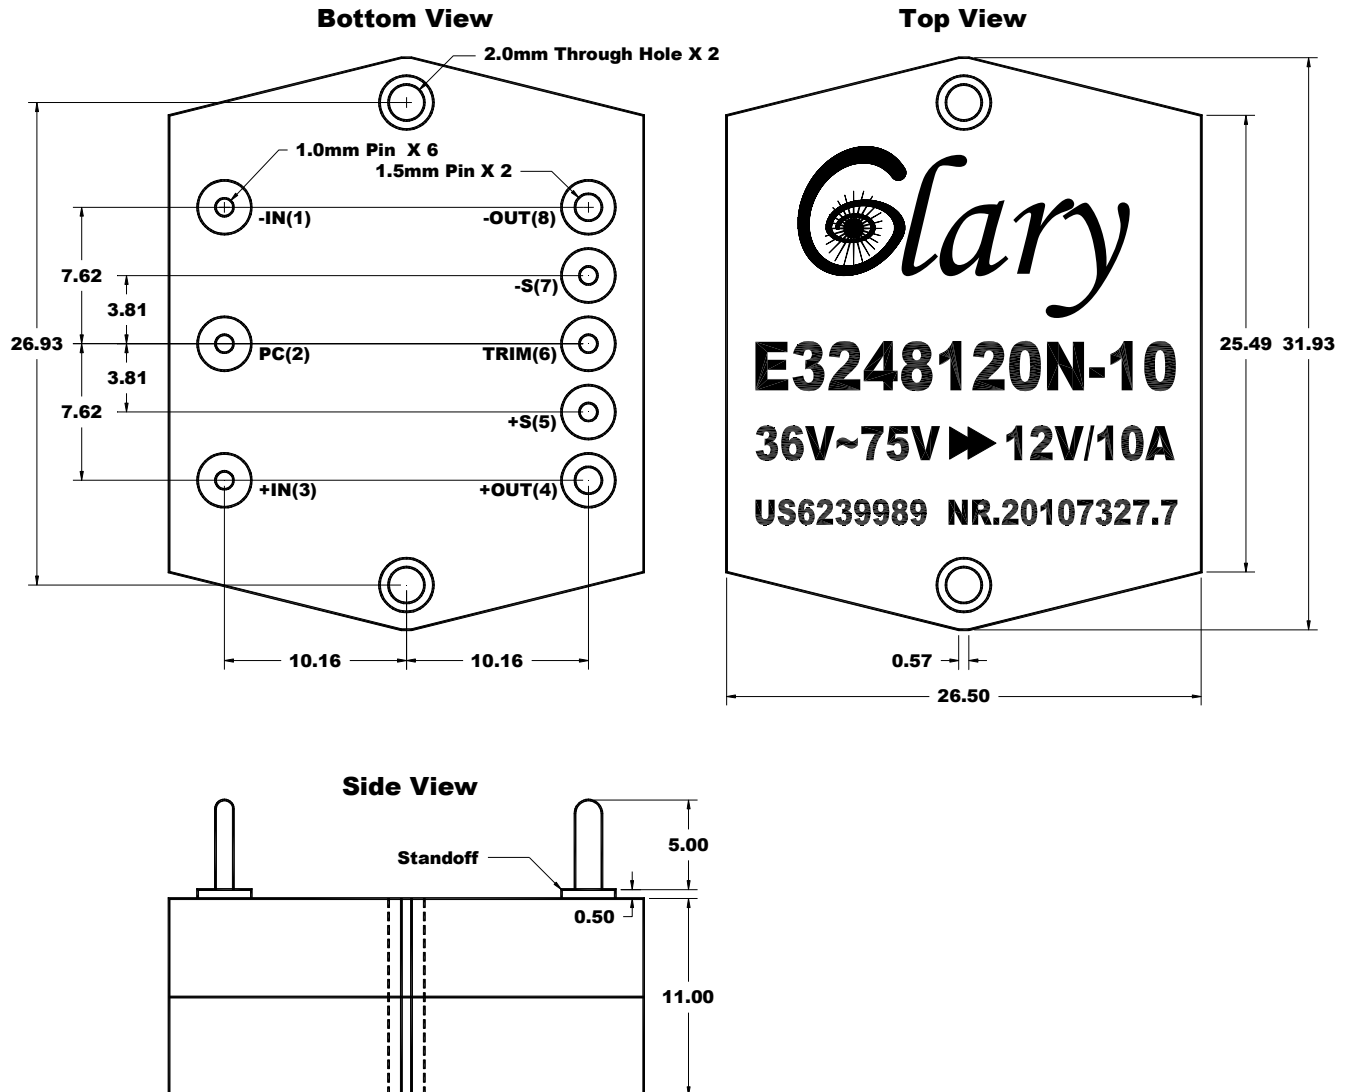

Fig. 4. Step-load response 0A/20A@2.5A/μS

NOTE:

1. It is recommended that the input should be protected by fuses or other protection devices.
2. Specifications are subject to change without notice.
3. Printed or downloaded datasheets are not subject to Glary document control.
4. Product labels shown, including safety agency certificates, may vary based on the date of manufacture.
5. Information provided in this documentation is for ordering purposes only.
6. This product is not designed for use in critical life support systems, nuclear control systems or other such applications, which necessitate specific safety and regulatory standards other than the ones listed in this datasheet.

IMPORTANT
※ In order to secure effective usage of converter and the validity of Glary's service and warranty coverage, please refer to the application notes for general usage. For needs of usage beyond the application notes, please contact to Glary headquarter or our regional sales representative office for help.
